Goal: Deliver the next meaningful increment of the system.

Select the next coherent increment of functionality from the pod's planned scope, implement it, integrate it with the existing system, and make it available in the deployed system for cross-team testing within your pod.

Your submission must include:

- the location of the deployed system or service;
- the location of the team's automated test runner and instructions sufficient to execute it;
- the new functionality delivered in this phase;
- automated tests for the new functionality and appropriate regression tests for existing functionality;
- updated system models as needed; and
- a brief description of what changed, what remains incomplete, and any known limitations.

The expectation is not simply that more code exists. The system should become meaningfully more capable while remaining deployable and testable.

The submission will update two artifacts: the class registry of deployed services and your team's project documentation. The **registry entry** must identify the deployed web service and automated test runner. The **team documentation** must be updated to reflect the system as delivered in this phase, including relevant models, interfaces, functionality, and known limitations.
